Approval sheet: next Plumbline job

For: Steve Moitozo II (S2) · **Drafted:** 2026-10-27 · **Status:** proposed. Nothing is opened or frozen until you sign.

The job: fix the three gaps you logged in Plumbline's custody emitter: (1) the finish time is copied from the start time, (2) a missing provider reply is neither refused nor flagged, and (3) stranger bundles leave out the event ledger and the harness logs.

Tick to approve, or write in a change.

☐	Decision	Recommended	Why
☐	1. Mode	Scored	You get a pass/fail verdict against fixed thresholds, not just readings.
☐	2. Entry	A (new, commissioned work)	The fix doesn't exist yet and the bar is written first. B would be a relabelled baseline (draft kept).
☐	3. Instrument profile	Full	All the checks this repair needs; the minimal profile drops some.
☐	4. Pass rule	Every check must pass (each check scores 0 or 1; all must score 1)	Matches "every check PASS" exactly. A failure retries until the cap, then comes to you.
☐	5. Limits	3 attempts; under US$10; under 10 hours	Same limits as the last job. Expected spend is under $1.
☐	6. Maker	DeepSeek V4.1 Flash 1017, one logged API call at a time. The Maker bot only sends the calls and applies the returned code unchanged.	Every call is logged, so times and endpoints come from evidence. Bot's role is disclosed. *(Decided by you 16:48 EDT.)*
☐	7. Evaluators	A test script (checks N1–N5, N7–N8) plus GLM 5.3 Flash (code reading N6), both run by the Evaluator bot, which gives no score of its own	Fixes last round's two failures: every judging batch has test cases, and every model read is logged.
☐	8. Providers (zero data retention, no fallback)	Maker: DeepInfra (fp8). GLM: Z.AI (fp8)	Different model family and different server, both no-retention, both 100 % up today. DeepInfra already worked with this emitter in round 2.
☐	9. Fixed versions	custody SPEC 3e3ca58 · Doctrine dc61854 · E-DI a48a4645 · Plumbline base ff350e3	Nothing upstream has moved, so the existing tests stay valid.
☐	10. Target level	CL1 for this job's own record	What you asked for; Grok Bot operators are recorded as "undisclosed".
☐	11. Domain standard	The custody spec and Doctrine §7, adopted by you	Same as the last job; no outside expert needed.
☐	12. Test cases hidden from evaluators	Kept outside both bots' folders and copied in only when a batch runs. Any remaining shared-box access is disclosed.	The box is shared, so this is the strongest step available.
☐	13. Which emitter writes this job's own record	Current main (ff350e3), not the code being fixed	The fixed code shouldn't certify itself. Its known finish-time gap is disclosed.

Bar to approve: `bar.md` sha256 `cce961c777b402af4314978303549958026 52d8033e3a0892e239081089eefbc` (draft; the hash changes once, at freeze, when the header changes to FROZEN).

Signed: _____ Date/time (ET): _____

Still open (none block your approval)

- **Job date** is a placeholder (`2026-10-2X`) until the open date is set.
- **Call logger** (`freeze/harness/or_call.py`, about 30 min to write, $0) is written before freeze. Its hash goes into the frozen pins.
- **Test fixtures and planted defects** (about 1 h, $0) are built after you approve, because they're variants of the Maker's code.
